NTG Pulse

Verified Freight Visibility for UK ↔ Nordics ROAD Corridors

TRP Group X NTG Nordic Transport Group

What we will cover

How NTG Pulse turns complex road corridors into verified shipment visibility

- **The problem**

  Road visibility is still fragmented, delayed and too dependent on carrier and driver data

- **The concept**

  Verified checkpoint event improve shipment trust, ETA confidence and exception handling

- **The PoC + pilot**

  The demo proves how gate events, validation logic and milestone tracking work together

- **Business value**

  Verified visibility creates differentiation, premium service potential and stronger customer confidence

From fragmented tracking to verified shipment milestones

The problem

ROAD visibility is still too fragmented, delayed and manual.

- **Fragmented data**
  Carrier systems, GPS, driver apps, emails and EDI updates do not always line up.
- **Low ETA confidence**
  Customers see status gaps around ports, ferries, tunnels and border crossings.
- **Manual pressure**
  “Where is my shipment?” inquiries create extra work for NTG teams.
- **Customer anxiety**
  B2B customers need predictability and proactive issue handling.

Blind spots happen exactly where delays hurt most.

Based on existing ANPR gate owners

NTG Pulse uses infrastructure that already exists.

Gate owners already scan vehicles

Ports, terminals, ferry sites, tunnels and logistics hubs often control access with ANPR or similar gate technology.

NTG does not need raw camera access

Matching happens locally at the partner site, controlled by the gate owner.

Only verified events are shared

NTG receives shipment ID, gate ID, timestamp, confidence score and status reason.

Whitelist-based by design

Only expected shipments on approved corridors are matched.

Pilot-ready model

Start with 3–5 strategic gates on the UK → Denmark corridor.

From camera infrastructure to verified freight visibility.

Who we solve it for

Two customer roles need faster, clearer and more reliable answers.

Logistics Manager

Oversees multiple ROAD shipments and needs control, predictability and proactive issue handling.

1
single source of truth

ETA
clear confidence

Operational Buyer / Customer Service User

Uses tracking data to answer end-customer questions without calling or emailing NTG.

0
unnecessary calls

24/7
mobile access

What about the driver? Where in the picture is he?

Prototype demo story

The PoC proves event logic, not a full production tracking platform.

- **Simulated gate events**
  A JSON event enters the system as if it came from a partner gate owner.
- **Validation engine**
  The event is checked before it becomes customer-visible information.
- **Timeline + ETA**
  Confirmed milestones update shipment progress and confidence.
- **Exception handling**
  Wrong gate, low confidence or route deviation is surfaced for review.

Why UK ↔ Nordics?

High complexity creates high value for verified visibility.

- **Multiple handoffs**
  Carrier and equipment changes can break a simple truck-based tracking model.
- **Critical chokepoints**
  Dover/Folkestone, Calais/Coquelles, Puttgarden and Rødby define progress.
- **ETA volatility**
  Ferry, tunnel, port and border uncertainty can change customer planning quickly.
- **Premium corridor**
  A strong proof here can become a differentiator in tenders and key accounts.

Market reality

Most visibility tools estimate location. NTG Pulse verifies key checkpoints.

GPS / telematics / geofencing

Useful and necessary, but still dependent on carrier compliance, device quality and data availability.

“We think the truck is here.”

Verified gate events

Physical checkpoints confirm that a shipment actually passed a critical milestone.

“We know the shipment passed here.”

Strategic gap: a corridor-specific truth layer above the existing visibility stack.

Core concept

Selected freight gates generate verified shipment milestones.

UK origin
Loaded

Folkestone
Checked in

Coquelles
EU entry

Rødby
DK entry

Copenhagen
Terminal

**The customer sees a clean timeline.
NTG sees confidence, exceptions and
next expected checkpoint.**

How it works

From raw partner event to customer-facing insight.

Gate event

Partner sends event-only checkpoint data

Ingestion API

Accepts JSON, EDI, webhook or SFTP

Milestone + ETA

Updates timeline, ETA and confidence status

Validation

Checks shipment, route, timing and confidence

Customer / Control Tower

Shows progress and exceptions

Operational Buyer / Customer Service User

Turns tracking uncertainty into customer-ready answers.

Answer without chasing internally

Verified checkpoint events reduce the need to call planners, carriers or operations just to confirm shipment progress.

Contact customers before they escalate

Delay signals and confidence changes give the user time to communicate proactively instead of reacting after the customer asks.

Give credible updates

Each answer is backed by a verified milestone, timestamp, gate ID and confidence score.

Free up time for exception handling

Less time spent finding information means more time solving the actual customer problem.

From “we are checking” to “here is the verified status.”

Privacy-safe model

Event-only, whitelist-based and purpose-limited.

What NTG receives

- Shipment ID
- Gate ID
- Timestamp
- Confidence
- Status reason

What NTG does not need

- Live video
- All plate reads
- Public camera access
- Full plate databases

Pilot governance

- Light DPIA
- Retention rules
- Access control
- Carrier/driver info

Raw matching stays local with the gate owner. NTG receives only verified shipment events.

Business value

The strongest case is not just fewer support emails.

- **Premium visibility product**
  Create a stronger service for high-value, time-sensitive customers.
- **Tender differentiation**
  Verified milestones become a clear digital advantage in bids.
- **Retention driver**
  Better transparency makes NTG easier to trust and harder to replace.
- **Operational efficiency**
  Fewer manual follow-ups and faster exception handling.

Support savings are a side benefit. Strategic value is the main argument.

90-day pilot plan

Small scope, measurable impact and realistic partnerships.

1 corridor

Jutland→ Funen → Zealand via Storebælt

3–5 gates

Padborg, Storebælt, Øresund, Vejlefjord and Kolding junction

Selected customers

High-value, cold chain, pharma or automotive/JIT

Measurable KPIs

ETA accuracy, inquiry reduction, usage, exceptions

Decision after pilot: expand, adjust or stop based on KPI evidence.

NTG Pulse

Roadmap: From Danish PoC to Verified Visibility Platform

A phased approach to turn verified checkpoint data into a commercial advantage for NTG

1 Phase 1
Pilot Tier 1 Danish checkpoints

- Padborg
- Storebælt
- Øresund
- Vejlefjord
- Kolding junction

- ANPR gate-event simulation
- Confidence score + mismatch handling
- Operational Buyer / Customer Service demo

Prove value in a controlled Danish pilot

2 Phase 2
Expand checkpoint coverage

- Ports, ferry terminals, hubs, yards
- Standardized event format
- Partner onboarding model
- Verified checkpoint network

Build the network. Standardize. Scale.

3 Phase 3
Add intelligence

- ETA prediction from route history
- Deviation detection
- Shipment risk alerts
- Customer-facing visibility link

Turn verified events into actionable insights

4 Phase 4
Scale across ROAD

- More corridors across Europe
- Premium visibility for key customers
- Tender differentiation
- NTG Pulse as a commercial visibility layer

From pilot to platform. From advantage to standard.

Not more tracking. Better proof.

Where complexity is highest, visibility is worth the most.

Questions?

- Current tech stack
- Demo
- Privacy-safe model
- Business value
- 90-day pilot plan
